- $\Omega_B \simeq 0.05$ observable matter: **electron, proton, neutron !**
- $\Omega_D \simeq 0.25$ dark matter: **WIMP? axion? sterile ν ? ...**
- $\Omega_\Lambda \simeq 0.70$ dark energy: **Λ -term? Quintessence?**
- $\Omega_R < 10^{-3}$ relativistic fraction: **relic photons and neutrinos**

Matter – dark energy coincidence: $\Omega_M/\Omega_\Lambda \simeq 0.45$, ($\Omega_M = \Omega_D + \Omega_B$)
 $\rho_\Lambda \sim \text{Const.}$, $\rho_M \sim a^{-3}$; *why $\rho_M/\rho_\Lambda \sim 1$ – just Today?*

Anthropic explanation: if not *Today*, then *Yesterday* or *Tomorrow*.

Baryon and dark matter Fine Tuning: $\Omega_B/\Omega_D \simeq 0.2$
 $\rho_B \sim a^{-3}$, $\rho_D \sim a^{-3}$: *why $\rho_B/\rho_D \sim 1$ - Yesterday Today & Tomorrow?*

Baryogenesis requires BSM Physics: **(GUT-B, Lepto-B, AD-B, EW-B ...)**

Dark matter requires BSM Physics: **(Wimp, Wimpzilla, sterile ν , axion, ...)**

Different physics for B-genesis and DM?

Not very appealing: looks as Fine Tuning

$$SU(3) \times SU(2) \times U(1) + SU(3)' \times SU(2)' \times U(1)'$$

$$G \times G'$$

Regular world

Mirror world

Elementary Particles

Elementary Particles

- Two identical gauge factors, e.g. $SU(5) \times SU(5)'$, with identical field contents and Lagrangians: $\mathcal{L}_{\text{tot}} = \mathcal{L} + \mathcal{L}' + \mathcal{L}_{\text{mix}}$

- Exact parity $G \rightarrow G'$: no new parameters in dark Lagrangian \mathcal{L}'

- MM is dark (for us) and has the same gravity

- MM is identical to standard matter, (asymmetric/dissipative/atomic) but realized in somewhat different cosmological conditions: $T'/T \ll 1$.

- New interactions between O & M particles \mathcal{L}_{mix}

new parameters – constrained only by experimental and astrophysical limits

$G \times G'$ complemented by concepts of SUSY, GUT, $U(1)_{PQ}$ etc.

- Flavor Physics – Flavor Gauge symmetry between families e.g. $SU(3)_H$ acting between two sectors – anomaly cancellation in case of PZ_2 symmetry

Can realize MFV scenario in the context of SUSY quark-squark alignment: $\hat{M}_d^2 = F(Y_d^\dagger Y_d)$, $A_d = F(Y_d)$ etc. **Z.B., PLB 1998**

Gauge flavor bosons and FC phenomenon, also as portal to DM

- SUSY Twin Higgs Exact parity $G \rightarrow G' \rightarrow$ accidental global $SU(4)$ – Little Higgs as PGB **Z.B., 2005**
- Common $U(1)_{PQ}$ between two sectors – heavy axion as portal to DM **Z.B., Gianfagna, Giannotti, 2000, also Rubakov 1998 in different context**
- Neutrino portal: sterile neutrinos as mirror neutrinos – also as origin of baryon asymmetry (see further ...)

– All you need is ... M world colder than ours !

For a long time M matter was not considered as a real candidate for DM: naively assuming that exactly identical microphysics of O & M worlds implies also their cosmologies are exactly identical :

- $T' = T, \quad g'_* = g_* \quad \rightarrow \quad \Delta N_\nu^{\text{eff}} = 6.15 \quad \text{vs.} \quad \Delta N_\nu^{\text{eff}} < 0.5 \quad (\text{BBN})$
- $n'_B/n'_\gamma = n_B/n_\gamma \quad (\eta' = \eta) \quad \rightarrow \quad \Omega'_B = \Omega_B \quad \text{vs.} \quad \Omega'_B/\Omega_B \simeq 5 \quad (\text{DM})$

But all is OK if : Z.B., Dolgov, Mohapatra, 1995 (*broken* PZ_2)
Z.B., Comelli, Villante, 2000 (*exact* PZ_2)

- after inflation M world was born colder than O world, $T'_R < T_R$
- any interactions between M and O particles are feeble and cannot bring two sectors into equilibrium in later epochs
- two systems evolve adiabatically (no entropy production): $T'/T \simeq \text{const}$

$T'/T < 0.5$ from BBN, but cosmological limits $T'/T < 0.2$ or so.

$$x = T'/T \ll 1 \quad \Rightarrow \quad \text{in O sector} \quad 75\% \text{ H} + 25\% \text{ } ^4\text{He}$$

$$\Rightarrow \quad \text{in M world} \quad 25\% \text{ H}' + 75\% \text{ } ^4\text{He}'$$

For broken PZ_2 , DM can be compact H' atoms or n' with $m \simeq 5 \text{ GeV}$ or (sterile) mirror neutrinos $m \sim \text{few keV}$ Z.B., Dolgov, Mohapatra, 1995

- CMB & (linear) structure formation epoch

Since $x = T'/T \ll 1$, mirror photons decouple before M-R equality:

$$z'_{\text{dec}} \simeq x^{-1} z_{\text{dec}} \simeq 1100 (T/T')$$

After that (and before M-reionization) M matter behaves as collisionless CDM and $T'/T < 0.2$ is consistent with Planck, BAO, Ly- α etc.

- **Cosmic dawn:** M world is colder (and helium dominated), the first M star can be formed earlier and reionize M sector ($z'_r \simeq 20$ or so vs $z_r = 10 \div 6$). – EDGES 21 cm at $z \simeq 17$?
Heavy first M stars ($M \sim 10^3 M_{\odot}$) and formation of central BH – Quasars?

- **Galaxy halos?** if $\Omega'_B \simeq \Omega_B$, M matter makes ~ 20 % of DM, forming dark disk, while ~ 80 % may come from other type of CDM (WIMP?)
But perhaps 100 % ? if $\Omega'_B \simeq 5\Omega_B$: – M world is helium dominated, and the star formation and evolution can be much faster. Halos could be viewed as mirror elliptical galaxies dominated by BH and M stars, with our matter forming disks inside.

Maybe not always: Galaxies with missing DM, or too many DM, etc. ?

Because of $T' < T$, the situation $\Omega'_B \simeq 5\Omega_B$ becomes plausible in baryogenesis. So, M matter can be dark matter (as we show below)

Experimental and observational manifestations

Baryon Number Violation in Cosmic Rays: paradoxes of UHECR and cosmic antinuclei

Summary

Chapter I: DM from Parallel 'Mirror' World

Chapter II: Neutron – mirror neutron oscillation $n - n'$

Chapter III: $n \leftrightarrow n'$ in Neutron Stars

Chapter IV: $n - n'$ in UHECR

Summary

Backup

A. Cosmological implications. $T'/T < 0.2$ or so, $\Omega'_B/\Omega_B = 1 \div 5$.

Mass fraction: H' – 25%, He' – 75%, and few % of heavier C', N', O' etc.

- Mirror baryons as **asymmetric/collisional/dissipative/atomic** dark matter: M hydrogen recombination and M baryon acoustic oscillations?
- Easier formation and faster evolution of stars: Dark matter disk? Galaxy halo as mirror elliptical galaxy? Microlensing ? Neutron stars? Black Holes? Binary Black Holes? Central Black Holes?

B. Direct detection. M matter can interact with ordinary matter e.g. via kinetic mixing $\epsilon F^{\mu\nu} F'_{\mu\nu}$, etc. Mirror helium as most abundant mirror matter particles (the region of DM masses below 5 GeV is practically unexplored). Possible signals from heavier nuclei C,N,O etc.

C. Oscillation phenomena between ordinary and mirror particles.

The most interesting interaction terms in \mathcal{L}_{mix} are the ones which violate B and L of both sectors. **Neutral particles, elementary (as e.g. neutrino) or composite (as the neutron or hydrogen atom) can mix with their mass degenerate (sterile) twins:** matter disappearance (or appearance) phenomena can be observable in laboratories.

In the Early Universe, these B and/or L violating interactions can give primordial baryogenesis and dark matter genesis, with $\Omega'_B/\Omega_B = 1 \div 5$.

B-L violation in O and M sectors: Active-sterile mixing

- $\frac{1}{M}(l\bar{\phi})(l\bar{\phi})$ ($\Delta L = 2$) – neutrino (seesaw) masses $m_\nu \sim v^2/M$
M is the (seesaw) scale of new physics beyond EW scale.

- **Neutrino -mirror neutrino mixing** – (active - sterile mixing)
Akhmedov, Z.B. and Senjanovic, 1992,
Foot and Volkas 1995, Z.B. and Mohapatra, 1995

L and L' violation: $\frac{1}{M}(l\bar{\phi})(l\bar{\phi})$, $\frac{1}{M}(l'\bar{\phi}')(l'\bar{\phi}')$ and $\frac{1}{M}(l\bar{\phi})(l'\bar{\phi}')$

Mirror neutrinos are natural candidates for sterile neutrinos

Co-leptogenesis: B-L violating interactions between O and M worlds

L and L' violating operators $\frac{1}{M}(l\bar{\phi})(l\bar{\phi})$ and $\frac{1}{M}(l\bar{\phi})(l'\bar{\phi}')$ lead to processes $l\phi \rightarrow \bar{l}\bar{\phi}$ ($\Delta L = 2$) and $l\phi \rightarrow \bar{l}'\bar{\phi}'$ ($\Delta L = 1, \Delta L' = 1$)

Asymmetric reheating: our world is heated and mirror is empty: but $l\phi \rightarrow \bar{l}'\bar{\phi}'$ heat also mirror world (but with $T' < T$)

- These processes should be **out-of-equilibrium**
- **Violate** baryon numbers in both worlds, $B - L$ and $B' - L'$
- **Violate** also CP, given complex couplings

Green light to celebrated conditions of Sakharov

Co-leptogenesis in both sectors **Z.B. and Bento, PRL 87, 231304 (2001)**
naturally explaining $\Omega'_B \simeq 5 \Omega_B$ **Z.B., IJMP A19, 3775 (2004)**

Co-leptogenesis:

Hot O World \rightarrow *Cold M World*

$$\frac{dn_{\text{BL}}}{dt} + (3H + \Gamma)n_{\text{BL}} = \Delta\sigma n_{\text{eq}}^2 \quad \frac{dn'_{\text{BL}}}{dt} + (3H + \Gamma')n'_{\text{BL}} = -\Delta\sigma' n_{\text{eq}}^2$$

$$\sigma(l\phi \rightarrow \bar{l}\bar{\phi}) - \sigma(\bar{l}\bar{\phi} \rightarrow l\phi) = \Delta\sigma$$

$$\sigma(l\phi \rightarrow \bar{l}'\bar{\phi}') - \sigma(\bar{l}'\bar{\phi}' \rightarrow l'\phi') = -(\Delta\sigma + \Delta\sigma')/2 \rightarrow 0$$

$$\sigma(l\phi \rightarrow l'\phi') - \sigma(\bar{l}'\bar{\phi}' \rightarrow \bar{l}\bar{\phi}) = -(\Delta\sigma - \Delta\sigma')/2 \rightarrow \Delta\sigma$$

$$\Delta\sigma = \text{Im Tr}[g^{-1}(Y^\dagger Y)^* g^{-1}(Y'^\dagger Y')g^{-2}(Y^\dagger Y)] \times T^2/M^4$$

$$\Delta\sigma' = \Delta\sigma(Y \rightarrow Y')$$

$$\text{Mirror } PZ_2: \quad Y' = Y^* \quad \rightarrow \quad \Delta\sigma' = -\Delta\sigma \quad \rightarrow \quad B, B' > 0$$

$$\text{If } k = \left(\frac{\Gamma}{H}\right)_{T=T_R} \ll 1$$

$$\Omega'_B = \Omega_B \simeq 10^3 \frac{JM_{\text{Pl}} T_R^3}{M^4} \simeq 10^3 J \left(\frac{T_R}{10^{11} \text{ GeV}}\right)^3 \left(\frac{10^{13} \text{ GeV}}{M}\right)^4$$

If $k = \left(\frac{\Gamma_2}{H}\right)_{T=T_R} \sim 1$, Boltzmann Eqs.

$$\frac{dn_{\text{BL}}}{dt} + (3H + \Gamma)n_{\text{BL}} = \Delta\sigma n_{\text{eq}}^2 \quad \frac{dn'_{\text{BL}}}{dt} + (3H + \Gamma')n'_{\text{BL}} = \Delta\sigma n_{\text{eq}}^2$$

should be solved with Γ :

$$D(k) = \Omega_B/\Omega'_B, \quad x(k) = T'/T \text{ for different } g_*(T_R) \text{ and } \Gamma_1/\Gamma_2.$$

So we obtain $\Omega'_B = 5\Omega_B$ when $m'_B = m_B$ but $n'_B = 5n_B$
 – the reason: mirror world is colder

Sign of BA is same for two sectors: $B > 0 \rightarrow B' > 0$
 in other terms, both sectors are left-handed

– Sign of mirror baryon asymmetry ?

Baryon Number Violation in Cosmic Rays: paradoxes of UHECR and cosmic antinuclei

Zurab Berezhiani

Summary

Chapter I: DM from Parallel 'Mirror' World

Chapter II: Neutron – mirror neutron oscillation $n - n'$

Chapter III: $n \leftrightarrow n'$ in Neutron Stars

Chapter IV: $n - n'$ in UHECR

Summary

Backup

Ordinary BA is positive: $\mathcal{B} = \text{sign}(n_b - n_{\bar{b}}) = 1$
– as produced by (unknown) baryogenesis a la Sakharov!

Sign of mirror BA, $\mathcal{B}' = \text{sign}(n_{b'} - n_{\bar{b}'})$, is a priori unknown!

Imagine a baryogenesis mechanism *separately* acting in O and M sectors!
– without involving cross-interactions in \mathcal{L}_{mix}

E.g. leptogenesis $N \rightarrow \ell\phi$ and $N' \rightarrow \ell'\phi'$

Z_2 : $\rightarrow Y'_{u,d,e} = Y_{u,d,e}$ i.e. $\mathcal{B}' = 1$

– O and M sectors are CP-identical in same chiral basis O=left, M=left

Z_2^{LR} : $\rightarrow Y'_{u,d,e} = Y_{u,d,e}^*$ i.e. $\mathcal{B}' = -1$

– O sector in L-basis is identical to M sector in R-basis O=left, M=right

In the absence of cross-interactions in \mathcal{L}_{mix} we cannot measure sign of BA (or chirality in weak interactions) in M sector – so all remains academic ...

But switching on cross-interactions, violating B/L & B'/-L' – as mixings
neutron–neutron' $\epsilon nn' + \text{h.c.}$ $\Delta(B-B') = 0$ or $\nu\nu' + \text{h.c.}$ $\Delta(L-L') = 0$
 $\mathcal{B}' = -1 \rightarrow \bar{n}' \rightarrow n$ M (anti)matter \rightarrow O matter but $\bar{\nu}' \rightarrow \bar{\nu}$
 $\mathcal{B}' = 1 \rightarrow n' \rightarrow \bar{n}$ M matter \rightarrow O antimatter but $\nu' \rightarrow \nu$

ZB, 'Matter, dark matter, and antimatter in our Universe,' *Int.J.Mod.Phys. A* **33**, no.31, 1844034 (2018)

B violating operators between O and M particles in \mathcal{L}_{mix}

Ordinary quarks u, d (antiquarks \bar{u}, \bar{d})
 Mirror quarks u', d' (antiquarks \bar{u}', \bar{d}')

- Neutron -mirror neutron mixing – (Active - sterile neutrons)

$$\frac{1}{M^5}(udd)(udd) \quad \& \quad \frac{1}{M^5}(udd)(u'd'd')$$

Oscillations $n \rightarrow \bar{n}$ ($\Delta B = 2$)

Oscillations $n \rightarrow \bar{n}'$ ($\Delta B = 1, \Delta B' = -1$) $B - B'$ is conserved

Neutron– antineutron mixing

Majorana mass of neutron $\epsilon(n^T C n + \bar{n}^T C \bar{n})$ violating B by two units comes from six-fermions effective operator $\frac{1}{M^5}(udd)(udd)$

It causes transition $n(udd) \rightarrow \bar{n}(\bar{u}\bar{d}\bar{d})$, with oscillation time $\tau = \epsilon^{-1}$

$$\epsilon = \langle n|(udd)(udd)|\bar{n}\rangle \sim \frac{\Lambda_{\text{QCD}}^6}{M^5} \sim \left(\frac{100 \text{ TeV}}{M}\right)^5 \times 10^{-25} \text{ eV}$$

Key moment: $n - \bar{n}$ oscillation destabilizes nuclei:
 $(A, Z) \rightarrow (A - 1, \bar{n}, Z) \rightarrow (A - 2, Z/Z - 1) + \pi^{\prime}s$

Present bounds on ϵ from nuclear stability

$$\epsilon < 2.5 \times 10^{-24} \text{ eV} \quad \rightarrow \quad \tau > 2.7 \times 10^8 \text{ s}$$

$$\epsilon < 7.5 \times 10^{-24} \text{ eV} \quad \rightarrow \quad \tau > 0.9 \times 10^8 \text{ s}$$

O, SK 2015

direct limit free n

Neutron – mirror neutron mixing

Effective operator $\frac{1}{M^5}(udd)(u'd'd')$ \rightarrow mass mixing $\epsilon n C n' + \text{h.c.}$
violating B and B' – but conserving $B - B'$

$$\epsilon = \langle n | (udd)(u'd'd') | \bar{n}' \rangle \sim \frac{\Lambda_{\text{QCD}}^6}{M^5} \sim \left(\frac{1 \text{ TeV}}{M} \right)^5 \times 10^{-10} \text{ eV}$$

Key observation: $n - \bar{n}'$ oscillation cannot destabilise nuclei:
 $(A, Z) \rightarrow (A - 1, Z) + n' (p' e' \bar{\nu}')$ forbidden by energy conservation

For $m_n = m_{n'}$, $n - \bar{n}'$ oscillation can be as fast as $\epsilon^{-1} = \tau_{n\bar{n}'} \sim 1 \text{ s}$
without contradicting experimental and astrophysical limits.

(c.f. $\tau > 10 \text{ yr}$ for neutron – antineutron oscillation)

Neutron disappearance $n \rightarrow \bar{n}'$ and regeneration $n \rightarrow \bar{n}' \rightarrow n$
can be searched at small scale 'Table Top' experiments

Neutrons are making 1/7 fraction of baryon mass in the Universe.

But most of neutrons are bound in nuclei

$n \rightarrow \bar{n}'$ conversions are effective only for free neutrons.

– it cannot occur for neutrons bound in nuclei – energy conservation!

Free neutrons are present only in

- Reactors & Spallation Facilities (challenge $\tau_{n\bar{n}'} < \tau_{dec} \simeq 10^3$ s)
- UHE Cosmic Rays: $p + \gamma \rightarrow n + \pi^+$, $N_A + \gamma \rightarrow N_{A-1} + n$
- $n \rightarrow \bar{n}'$ can take place in Neutron Stars (gravitationally bound)
– conversion of NS into mixed ordinary/mirror NS

Neutron – mirror neutron oscillation probability

$$H = \begin{pmatrix} m_n + V_n + \mu_n \mathbf{B} \sigma & \epsilon \\ \epsilon & m_n + V'_n + \mu_n \mathbf{B}' \sigma \end{pmatrix}$$

The probability of n-n' transition depends on the relative orientation of magnetic and mirror-magnetic fields. The latter can exist if mirror matter is captured by the Earth

$$P_B(t) = p_B(t) + d_B(t) \cdot \cos \beta$$

$$p(t) = \frac{\sin^2 [(\omega - \omega')t]}{2\tau^2(\omega - \omega')^2} + \frac{\sin^2 [(\omega + \omega')t]}{2\tau^2(\omega + \omega')^2}$$

$$d(t) = \frac{\sin^2 [(\omega - \omega')t]}{2\tau^2(\omega - \omega')^2} - \frac{\sin^2 [(\omega + \omega')t]}{2\tau^2(\omega + \omega')^2}$$

where $\omega = \frac{1}{2}|\mu B|$ and $\omega' = \frac{1}{2}|\mu B'|$; τ - oscillation time

$$A_B^{\text{det}}(t) = \frac{N_{-B}(t) - N_B(t)}{N_{-B}(t) + N_B(t)} = N_{\text{collis}} d_B(t) \cdot \cos \beta \leftarrow \text{asymmetry}$$

6 helium-3 and 2 helium-4 with energies \sim GeV
 $\Phi(\overline{\text{He}})/\Phi(\text{He}) \sim 10^{-8}$ – no anti deuteron candidate

Discovery of a single anti-He-4 nucleus challenges all known physics.
AMS-02 signal (once published) will bring to a revolution in Physics

STing promised that AMS-02 will publish the anti-nuclei data as soon as they see first anti-carbon

My scenario is optimistic – this depends in burning conditions in antimatter core for nuclear reactions – depends on age, central density etc. – First it should start to produce helium as in the Sun (without initial Helium) – but then it can go to produce C-N-O and perhaps further ...

Everything is very simple as possible – but not simpler

$n - n'$ and Extreme Energy Cosmic Rays:
where do they all come from? and where do they all
belong?

*ZB and Bento, 'Fast neutron: Mirror neutron oscillation and ultra high energy cosmic rays,' Phys. Lett. B **635**, 253 (2006)*

*ZB and Gazizov, 'Neutron Oscillations to Parallel World: Earlier End to the Cosmic Ray Spectrum?,' Eur. Phys. J. C **72**, 2111 (2012)*

Cosmic Rays at highest energies

- $E < 1 \text{ TeV} = 10^{12} \text{ eV}$ moderate energies
- $E < 1 \text{ PeV} = 10^{15} \text{ eV}$ knee – galactic CR
- $E > 1 \text{ EeV} = 10^{18} \text{ eV}$ UHECR: extragalactic
- $E > 50 \text{ EeV}$ (GZK cutoff) $E > 100 \text{ EeV} = 10^{20} \text{ eV}$ EECR

Events with $E > 100 \text{ EeV}$ were observed
 Cosmic Zevatrons exist in the Universe – but where is the End?

UHECR as protons and GZK cutoff

GZK cutoff:

Photo-pion production on the CMB if $E > E_{\text{GZK}} \approx \frac{m_{\pi} m_p}{\epsilon_{\text{CMB}}} \approx 6 \times 10^{19} \text{ eV}$:

$p + \gamma \rightarrow p + \pi^0$ (or $n + \pi^+$), $l_{\text{mfp}} \sim 5 \text{ Mpc}$ for $E > 10^{20} \text{ eV} = 100 \text{ EeV}$

Neutron decay: $n \rightarrow p + e + \bar{\nu}_e$, $l_{\text{dec}} = \left(\frac{E}{100 \text{ EeV}}\right) \text{ Mpc}$

Neutron on CMB scattering: $n + \gamma \rightarrow n + \pi^0$ (or $p + \pi^-$)

UHECR as nuclei – but still cutoff

Chapter IV:
 $n - n'$ in
UHECR

Summary

Backup

- **Who are carriers of UHECR? (chemical content)**

Chemical content: extragalactic UHECR are protons for $E = 1 \div 10$ EeV. But UHECR become gradually heavier nuclei above $E > 10$ EeV or so
Disappointing Model – or perhaps new physics?

- **Different anistropies from North and South?**

TA disfavors isotropic distribution at $E > 57$ EeV, observes hot spot for $E > E_{GZK}$. PAO anisotropies not prominent: a spot around Cen A and warm spot at NGC 253 – **are two skies really different?**

- **Arrival directions?**

$E > 100$ EeV are expected from local supercluster (Virgo cluster etc.) and/or closeby structures. But they do not come from these directions. TA has small angle correlation for $E > 100$ EeV events (3 doublets) which may indicate towards strong sources – but no sources are associated
– **where do they all come from?**

- **Who are cosmic Zevatrons?**

Several candidates on Hillas Plot (AGN, HBL, SBG, GRB etc.)
– **but no reliable acceleration mechanism**

Association with close sources (SBG, AGN etc,)

Zurab Berezhiani

Summary

Chapter I: DM from Parallel 'Mirror' World

Chapter II: Neutron - mirror neutron oscillation $n - n'$

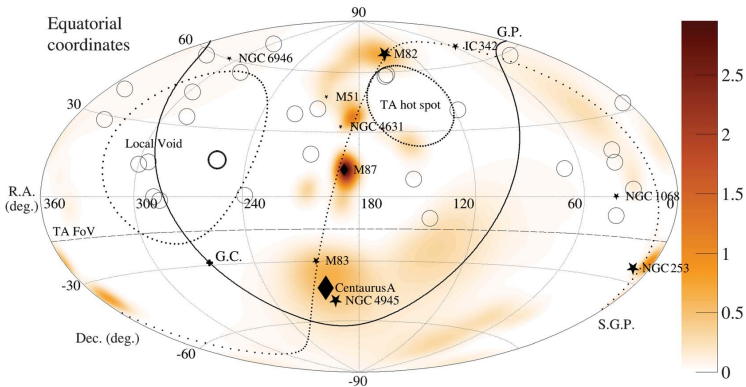

Chapter III: $n \leftrightarrow n'$ in Neutron Stars

Chapter IV: $n - n'$ in UHECR

Summary

Backup

$$\frac{n'_{\text{CMB}}}{n_{\text{CMB}}} = \left(\frac{T'}{T}\right)^3 \ll 1 \quad \rightarrow \quad \frac{\ell'_{\text{mfp}}}{\ell_{\text{mfp}}} \simeq \left(\frac{T}{T'}\right)^3 \gg 1$$

$n - n'$ oscillation in the UHECR propagation

Baryon number is **not conserved** in propagation of the UHECR

$$H = \begin{pmatrix} \mu_n \mathbf{B} \sigma & \epsilon \\ \epsilon & \mu_n \mathbf{B}' \sigma \end{pmatrix} \times (\gamma = E/m_n)$$

In the intergalactic space magnetic fields are extremely small ... but for relativistic neutrons transverse component of B is enhanced by Lorentz factor: $B_{\text{tr}} = \gamma B$ ($\gamma \sim 10^{11}$ for $E \sim 100$ EeV)

Average oscillation probability:

$$P_{nn'} = \sin^2 2\theta_{nn'} \sin^2(\ell/\ell_{\text{osc}}) \simeq \frac{1}{2} [1 + Q(E)]^{-1} \quad \tan 2\theta_{nn'} = \frac{2\epsilon}{\gamma \mu_n \Delta B}$$

$$Q = (\gamma \Delta B / 2\epsilon)^2 \approx 0.5 \left(\frac{\tau_{nn'}}{1 \text{ s}}\right)^2 \left(\frac{\Delta B}{1 \text{ fG}}\right)^2 \left(\frac{E}{100 \text{ EeV}}\right)^2 \quad \Delta B = |B_{\text{tr}} - B'_{\text{tr}}|$$

$$\text{If } q = 0.5 \left(\frac{\tau_{nn'}}{1 \text{ s}}\right)^2 \left(\frac{\Delta B}{1 \text{ fG}}\right)^2 < 1,$$

$n - n'$ oscillation becomes effective for $E = 100$ EeV

The UHECR spectra observed by TA and PAO are perfectly concordant (after 10% rescaling) at energies up to 10 EeV ... but become increasingly discordant at higher energies, very strongly above the GZK cutoff (60 EeV)

The discrepancy can be due to difference between the N- and S-skies!
N-sky is well structured, with prominent overdensities and large voids ...
S-sky is more amorphous with diffuse galaxies ...

It is unlikely that PAO–TA discrepancy is due to different power of sources within the GZK radius (no correlation with the galaxy distribution at $E > 80$ EeV, no event from the Virgo or Fornax clusters, etc.)

But it can be explained in "Swiss Cheese" model: UHECR above 80 – 100 EeV are born from mirror UHECR via $n' - n$ conversion in nearby voids within the radius $\sim 50 - 100$ Mpc (**Voids = small magnetic fields**)

The TA signal at super-GZK energies is boosted by prominent Voids in N-hemisphere. This can also explain intermediate scale anisotropies (20-30 degrees) in the TA arrival directions Interestingly, the TA/PAO spectra are concordant in the common sky ...

My hypothesis is testable with the new data of TA/PAO at higher statistics on $E > 100$ EeV events for which typical "voidity" radius is ~ 50 Mpc

Implication for cosmogenic neutrinos. Mirror Sector is Helium dominated, and in mirror UHECR ${}^4\text{He}'$ can be more than p' . So neutrons can be produced also by ${}^4\text{He}' + \gamma' \rightarrow {}^3\text{He}' + n'$. Subsequent decay $n' \rightarrow p' e' \bar{\nu}'$ and (sterile-active) oscillation $\nu' \rightarrow \nu$ can produce large flux of cosmogenic neutrinos which may explain astrophysical neutrino flux of IceCube above 100 TeV at higher redshifts

$n - n'$ conversion also has interesting implications for the neutron stars (gradual conversion of the neutron stars into mixed ordinary-mirror stars till achieving "fifty-fifty" mixed twin star configuration with $\sqrt{2}$ times smaller radius and maximal mass ...

Remarkably, it can be tested in laboratories via looking for anomalous (magnetic field dependent) disappearance of the neutrons (for which there already exist some experimental indications, most remarkable at the 5.2σ level) due to $n \rightarrow n'$ conversion and "walking through the wall" experiments ($n \rightarrow n' \rightarrow n$ regeneration). $n - n'$ oscillation can be also related to the neutron lifetime puzzle.

Summary

Backup

Cross-interactions can induce mixing of neutral particles between two sectors, e.g. $\nu - \nu'$ oscillations (M neutrinos = sterile neutrinos)

Oscillation $n \rightarrow n'$ can be very effective process, **faster than the neutron decay**. For certain parameters it can explain the neutron lifetime problem, 4.5σ discrepancy between the decay times measured by different experimental methods (bottle and beam), or anomalous neutron losses observed in some experiments and paradoxes in the UHECR detections

$n \rightarrow n'$ transition can have observable effects on neutron stars. It creates dark cores of M matter in the NS interiors, or eventually can transform them into maximally mixed stars with equal amounts of O and M neutrons

Such transitions in mirror NS create O matter cores. If baryon asymmetry in M sector has opposite sign, transitions $\bar{n}' \rightarrow \bar{n}$ create antimatter cores which can be seen by LAT **by accreting ordinary gas** and explain the origin of anti-helium nuclei in cosmic rays **supposedly seen by AMS2**

I argued that in O and M worlds baryon asymmetries can have same signs: $B > 0$ and $B' > 0$. Since $B - B'$ is conserved, our neutrons have transition $n \rightarrow \bar{n}'$ (which is the antiparticle for M observer)

while n' (of M matter) oscillates $n' \rightarrow \bar{n}$ into our antineutron
Neutrons can be transformed into antineutrons, but (happily) with low efficiency: $\tau_{n\bar{n}} > 10^8$ s

dark neutrons, before they decay, can be effectively transformed into our antineutrons in controllable way, by tuning vacuum and magnetic fields, if $\tau_{n\bar{n}'} < 10^3$ s

$E = 2m_n c^2 = 3 \times 10^{-3}$ erg
per every \bar{n} annihilation

Two civilisations can agree to built scientific reactors and exchange neutrons ... we could get plenty of energy out of dark matter !

E.g. mirror source with 3×10^{17} n/s (PSI) \rightarrow power = 100 MW

First Part: Against Stupidity ...

Second Part: ...The Gods Themselves ...

Third Part: ... Contend in Vain?

*"Mit der Dummheit kämpfen Götter
selbst vergebens!"* – Schiller

Radiochemist Hallam constructs the "Pump": a cheap, clean, and apparently endless source of energy functioning by the matter exchange between our universe and a parallel universe

His "discovery" was inspired by beings of parallel (mirror) world where stars were very old and so too cold – they had no more energy resources and were facing full extinction ...

$$2 \times 2 = 4 !$$

Z.B., Eur.Phys.J C81:33 (2021), arXiv:2002.05609

4 states: $n, \bar{n} : n', \bar{n}'$ and mixing combinations:

$$n \longleftrightarrow \bar{n} \quad (\Delta B = 2) \quad \& \quad n' \longleftrightarrow \bar{n}' \quad (\Delta B' = 2)$$

$$n \longleftrightarrow n' \quad + \quad \bar{n}' \longleftrightarrow \bar{n} \quad \Delta(B - B') = 0$$

$$n \longleftrightarrow \bar{n}' \quad + \quad n' \longleftrightarrow \bar{n} \quad \Delta(B + B') = 0$$

Full Hamiltonian is 8×8 :

$$\begin{pmatrix} m_n + \mu \vec{B} \vec{\sigma} & \epsilon_{n\bar{n}} & \epsilon_{nn'} & \epsilon_{n\bar{n}'} \\ \epsilon_{n\bar{n}} & m_n - \mu \vec{B} \vec{\sigma} & \epsilon_{n\bar{n}'} & \epsilon_{nn'} \\ \epsilon_{nn'} & \epsilon_{n\bar{n}'} & m'_n + V'_n + \mu' \vec{B}' \vec{\sigma} & \epsilon_{n\bar{n}} \\ \epsilon_{n\bar{n}'} & \epsilon_{nn'} & \epsilon_{n\bar{n}} & m'_n + V'_n - \mu' \vec{B}' \vec{\sigma} \end{pmatrix}$$

Present bounds on oscillation time $\tau_{n\bar{n}} = \epsilon^{-1}$:

$$\tau_{n\bar{n}} > 0.86 \times 10^8 \text{ s} \quad (\text{free } n), \quad \tau_{n\bar{n}} > 4.7 \times 10^8 \text{ s} \quad (\text{bound } n)$$

$$P_{n\bar{n}}(t) = \frac{t^2}{\tau_{n\bar{n}}^2} = \left(\frac{10^8 \text{ s}}{\tau_{n\bar{n}}} \right)^2 \left(\frac{t}{0.1 \text{ s}} \right)^2 \times 10^{-18}$$

Shortcut for $n \rightarrow \bar{n}$ via $n \rightarrow n' \rightarrow \bar{n}$

Consider case when direct $n - \bar{n}$ mixing simply absent: $\epsilon_{n\bar{n}} = 0$

Anyway, $n \rightarrow \bar{n}$ emerges as second order effect via $n \rightarrow n' \bar{n}' \rightarrow \bar{n}$

$$\bar{P}_{n\bar{n}} = \bar{P}_{nn'} \bar{P}_{n\bar{n}'}$$

$$\bar{P}_{nn'} = \frac{2\epsilon_{nn'}^2 \cos^2(\beta/2)}{(\Omega - \Omega')^2} + \frac{2\epsilon_{nn'}^2 \sin^2(\beta/2)}{(\Omega + \Omega')^2}, \quad \bar{P}_{n\bar{n}'} = \frac{2\epsilon_{n\bar{n}'}^2 \sin^2(\beta/2)}{(\Omega - \Omega')^2} + \frac{2\epsilon_{n\bar{n}'}^2 \cos^2(\beta/2)}{(\Omega + \Omega')^2}$$

where β is the (unknown) angle between the vectors \vec{B} and \vec{B}'

Disappearance experiments measure the sum $P_{nn'} + P_{n\bar{n}'} \propto \epsilon_{nn'}^2 + \epsilon_{n\bar{n}'}^2$

$n - \bar{n}$ transition measures the product $P_{n\bar{n}} = P_{nn'} P_{n\bar{n}'} \propto \epsilon_{nn'}^2 \epsilon_{n\bar{n}'}^2$

From the ILL'94 limit $P_{n\bar{n}} < 10^{-18}$ (measured at $B = 0$) we get

$$\tau_{nn'} \tau_{n\bar{n}'} > \frac{2 \times 10^9}{\Omega'^2} \approx \left(\frac{0.5 \text{ G}}{B'} \right)^2 \times 100 \text{ s}^2$$

E.g. $\tau_{nn'} \tau_{n\bar{n}'} \sim 1$ second is possible if $B' \sim 5 \text{ G}$

Limits become even weaker if $\Delta m > 0.1 \text{ neV}$

How good the shortcut can be?

Chapter II:
Neutron - mirror
neutron
oscillation $n - n'$

Chapter III:
 $n \leftrightarrow n'$ in
Neutron Stars

Chapter IV:
 $n - n'$ in
UHECR

Summary

Backup

Assuming e.g. $\tau_{nn'} \tau_{n\bar{n}'} = 100$ s and $B' = 0.5$ G, we see that ILL94-like measurement at $B = 0.45$ G (or $B = 0.49$ G) would give $P_{n\bar{n}} \simeq \sin^2 \beta \times 10^{-15}$ (or $P_{n\bar{n}} \simeq \sin^2 \beta \times 10^{-12}$)

To maximalize $n - \bar{n}$ probability, one has to match resonance with about 1 mG precision: we get

$$P_{nn'}(t) = \left(\frac{t}{\tau_{nn'}}\right)^2 \cos^2 \frac{\beta}{2}, \quad P_{n\bar{n}'}(t) = \left(\frac{t}{\tau_{n\bar{n}'}}\right)^2 \sin^2 \frac{\beta}{2}$$

and

$$P_{n\bar{n}}(t) = P_{nn'}(t)P_{n\bar{n}'}(t) = \frac{\sin^2 \beta}{4} \left(\frac{t}{0.1 \text{ s}}\right)^4 \left(\frac{100 \text{ s}^2}{\tau_{nn'} \tau_{n\bar{n}'}}\right)^2 \times 10^{-8}$$

Practically no limit from nuclear stability

E.g. ^{16}O decay time predicted $\sim 10^{60}$ yr vs. present limit $\sim 10^{32}$ yr !

A_B - Raw

$4\sigma \rightarrow 2.5\sigma$ effect

Back to trap-beam problem: τ_n vs. β -asymmetry

Updated Fig.7 from Belfatto, Beradze and Z.B, EPJ C 80, 149 (2020)

$$g_A = 1.27625(50)$$

$$\tau_{\text{beam}} = 888.0 \pm 2.0 \text{ s}$$

$$\tau_{\text{trap}} = 878.5 \pm 0.5 \text{ s}$$

Free neutron decay:

$$G_V^2 = \frac{K / \ln 2}{\mathcal{F}_n \tau_n (1 + 3g_A^2)(1 + \Delta_R)}$$

$0^+ - 0^+$ decays:

$$G_V^2 = \frac{K}{2\mathcal{F}t(1 + \Delta_R)}$$

$$\tau_n = \frac{2\mathcal{F}t}{\mathcal{F}_n(1 + 3g_A^2)} = \frac{5172.1(1.1 \rightarrow 2.8)}{1 + 3g_A^2} \text{ s} \quad \text{Czarnecki et al. 2018}$$

G_V and Δ_R cancel out even in BSM $G_V \neq G_F |V_{ud}|$: $g_A = -G_A/G_V$

$$g_A = 1.27625(50) \rightarrow \tau_n^{\text{theor}} = 878.7 \pm (0.6 \rightarrow 1.5) \text{ s} \approx \tau_{\text{trap}}$$

Baryon Number Violation in Cosmic Rays: paradoxes of UHECR and cosmic antinuclei

Zurab Berezhiani

Summary

Chapter I: DM from Parallel 'Mirror' World

Chapter II: Neutron - mirror neutron oscillation $n - n'$

Chapter III: $n \leftrightarrow n'$ in Neutron Stars

Chapter IV: $n - n'$ in UHECR

Summary

Backup

$$\tau_n^{\text{theor}} = 878.7 \pm 1.5 \text{ s} \quad \tau_{\text{trap}} = 878.5 \pm 0.5 \text{ s} \quad (\text{compatible})$$

$$\tau_{\text{beam}} = 888.0 \pm 2.0 \text{ s} \quad (4.5\sigma)$$

$$\tau_{\text{mat}} = 880.1 \pm 0.7 \text{ s} \quad \tau_{\text{magn}} = 877.8 \pm 0.3 \text{ s} \quad (3.3\sigma \text{ discrepancy})$$

So experimentally we have $\tau_{\text{magn}} < \tau_{n \rightarrow p}^{\text{theor}} < \tau_{\text{mat}} < \tau_{\text{beam}}$

which is possible in $n - n'$ oscillation scenario **So far so Good!**

Dark matter Factory ?

If my hypothesis is correct, a simple solenoid (magn. field \sim Tesla) can be an effective machine transforming neutrons into DM neutrons

With good adiabatic conditions 50 % transformation can be achieved

$$P_{nn'}^{\text{tr}} \approx \frac{\pi}{4} \xi \simeq 10^{-2} \left(\frac{2 \text{ km/s}}{v} \right) \left(\frac{P_{nn'}^0}{10^{-6}} \right) \left(\frac{B_{\text{res}}}{1 \text{ T}} \right) \left(\frac{R_{\text{res}}}{10 \text{ cm}} \right)$$
