Sidebar 7.2 How Nuclear Theory Fosters Innovation

The nuclear theory ecosystem functions holistically to guide and support experimental programs, develop the theoretical and computational directions of the future, and communicate and integrate new results with other science and technology domains. It also provides invaluable workforce to critical areas of the US economy. Universities and national laboratories are the engines that drive us toward these intertwined short-, medium-, and long-term goals. The last decade has seen several advances that have sprouted in small local research groups, flourishing there until the ideas and methods could be widely adopted and incorporated into the priorities of larger parts of the ecosystem. Here we discuss two representative examples.

[S55]

Full quantification of uncertainties in predictions

Around the time of the last LRP, several researchers in university and laboratory groups began using data-intensive Bayesian statistical methods to systematically include nuclear physics model uncertainties in predictions and in parameter inference. The resulting methods have improved our ability to compare theory with experiment in all subfields of nuclear science. One science application is the Bayesian analysis of the transport particles of dense nuclear matter. These methods are now part of the toolkit employed in many larger efforts (e.g., topical collaborations) and are being disseminated through multi-institutional collaborations such as the Bayesian Analysis of Nuclear Dynamics Cyberinfrastructure for Sustained Scientific Innovation (CSSI) software framework. The ability to better fit and compare theory with data is also beneficial to the nuclear data enterprise. Because research in this area involves data analysis and machine learning tools, students working on these projects have proven highly employable beyond nuclear physics, proceeding, for example, to careers in quantum computing, to data-driven activities in other research fields such as medical science, and throughout the private sector.

8

DEVELOPING A NUCLEAR WORKFORCE FOR THE BENEFIT OF SOCIETY

8.1 INTRODUCTION

People are central to the scientific enterprise. A discussion of the compelling nuclear science for the next decade must inherently include a discussion of the people—at every level—who will pursue that science and the skills and societal applications that spring from it.

A skilled nuclear science workforce contributes substantially to US innovation and economic growth, including the development of new machine learning tools for finance, the careful and state-of-the-art treatment of cancer patients, and the education of the next generation (Sidebars 8.1 and 2.1 highlight some of these individuals). However, the number of

Experiment

From Data to Discovery: How Machine Learning and Statistics are Fueling Understanding in Nuclear

Physics - Recent advances in cutting-edge machine learning and advanced statistical methods are transforming science across all disciplines. The lead speaker will discuss how these advances are fueling the understanding in nuclear physics and the role that open-source science and community-driven development plays in lowering the barrier for participation in the computational sciences. The speaker will also describe efforts to build inclusive online collaboration spaces and share resources for kickstarting the uptake of advanced scientific computing. All contributed speakers and the audience in the session will have the opportunity to collaborate and participate in this endeavour.

DNP 2024

Fall Meeting of the APS
Division of Nuclear Physics

October 7-10

Let's normalize the conversation

Lifting the Shadows: DEI Panel - This session aims to create an open space to discuss the impact that disruptive behaviors – including sexual harassment and general mistreatment – have on the workforce, and to identify community-driven efforts we can adopt to better protect those that are most vulnerable. After the presentations the speakers and audience will engage in a panel discussion directly addressing these issues in an attempt to foster alliances, share ideas, and work together to lift the shadows disrupting our community.

RECOMMENDATION 1

... to capitalize on the extraordinary opportunities for scientific discovery... **We must draw on the talents of all in the nation to achieve this goal.**

- Expanding policy and resources to ensure a **safe and respectful environment for everyone,** realizing the full potential of the US nuclear workforce.

Yes, Sexual Harassment Still Drives Women Out of Physics

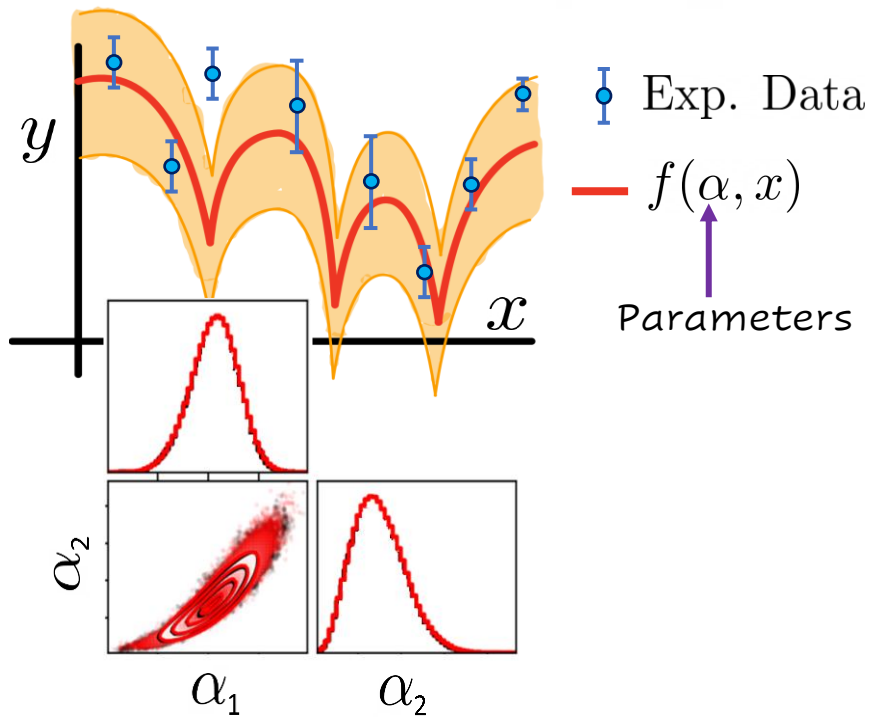

by Julie Libarkin, 2019

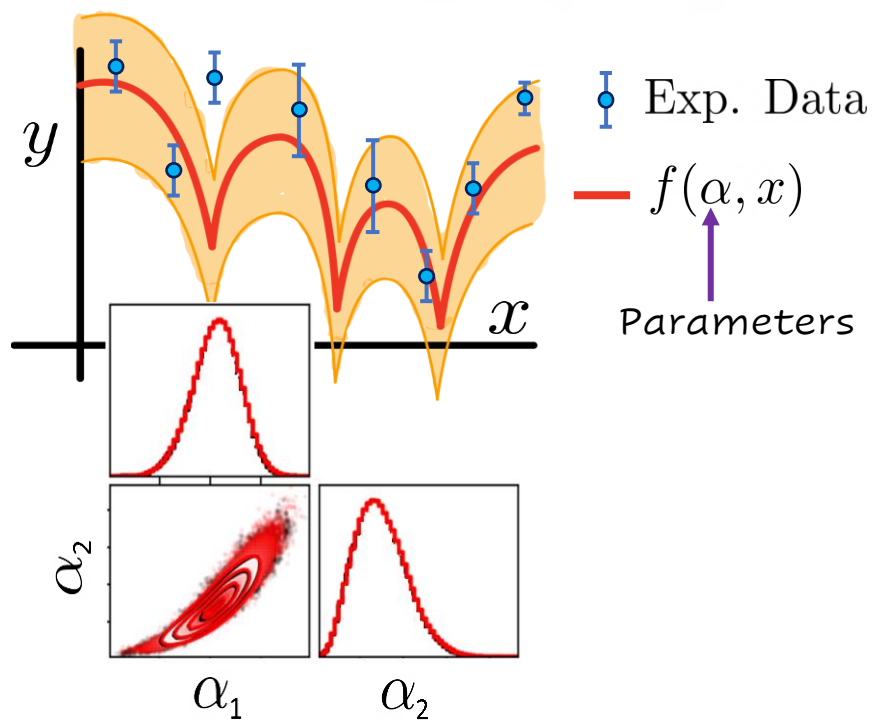

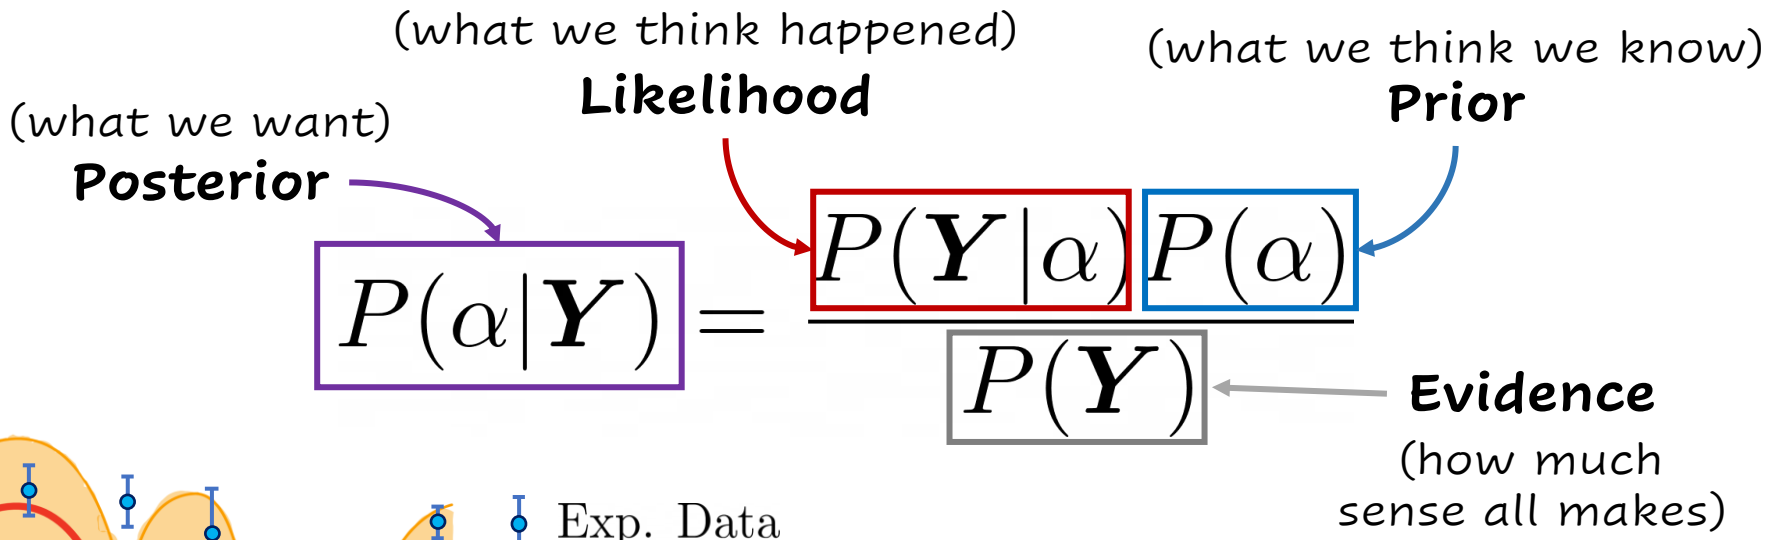

Nearly **three-quarters** of the roughly **500** undergraduate respondents **experienced some form of sexual harassment.**

Bayesian Formulation

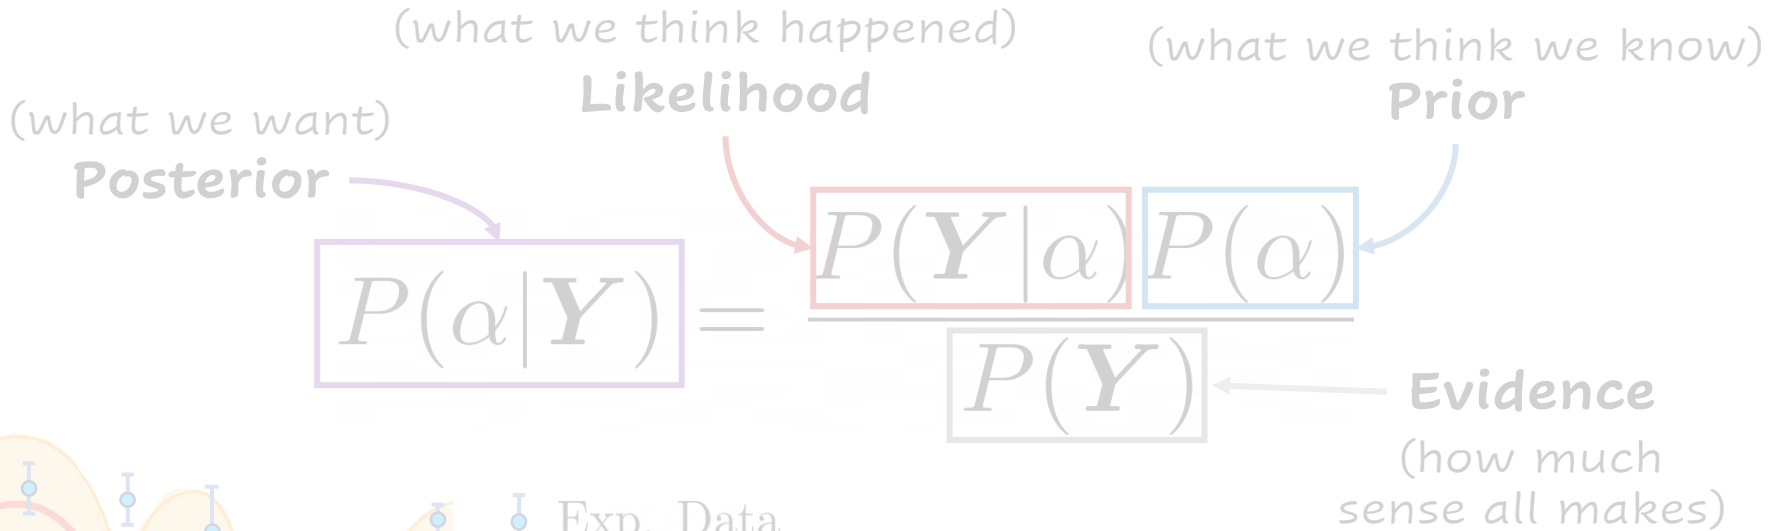

$$P(\alpha|\mathbf{Y}) = \frac{P(\mathbf{Y}|\alpha)P(\alpha)}{P(\mathbf{Y})}$$

Bayesian Formulation

Bayesian Formulation

Advantages:

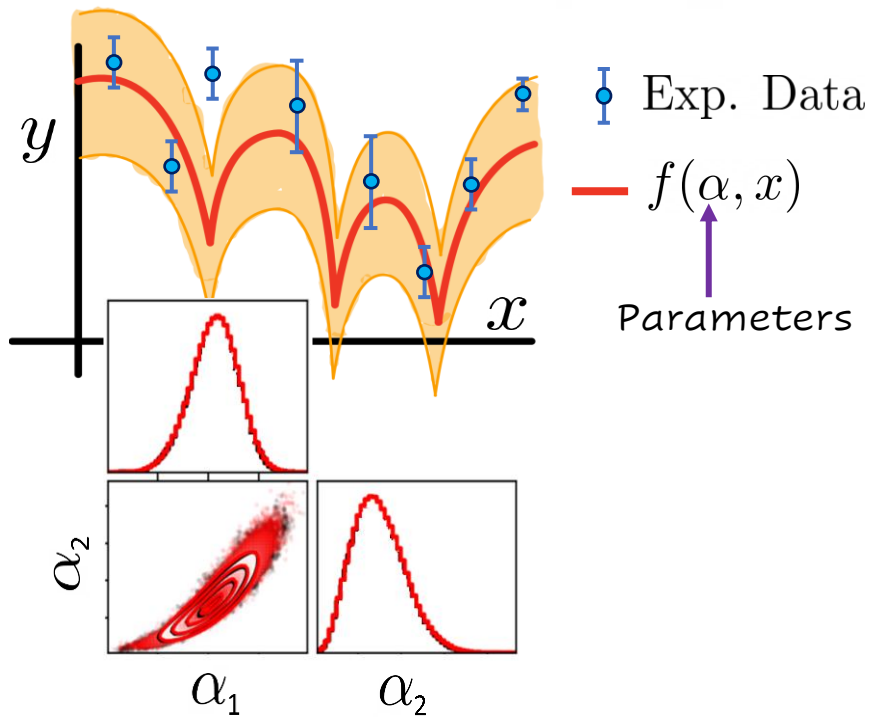

- 1) Assumptions are clearly stated
- 2) Allows for natural continuous learning

Challenge 1: repeated evaluations

Likelihood

$$P(\alpha | \mathbf{Y}) = \frac{P(\mathbf{Y} | \alpha) P(\alpha)}{P(\mathbf{Y})}$$

$\begin{bmatrix} \phi(x_1) \\ \phi(x_2) \\ \vdots \\ \phi(x_N) \end{bmatrix}$ \mathcal{N} (300) \gg n (2)

Dimension

Harmonic Oscillator Solutions

How it works

Quantum Harmonic Oscillator

Reduced Basis

$$\phi(x) \approx a_1\phi_1(x) + a_2\phi_2(x)$$

How it works

Quantum Harmonic Oscillator

Reduced Basis

$$\phi(x) \approx a_1\phi_1(x) + a_2\phi_2(x)$$

$$\underbrace{H_\alpha \phi(x) = \lambda \phi(x)}_{F_\alpha[\phi(x)] = 0}$$

How it works

Quantum Harmonic Oscillator

Reduced Basis

$$\phi(x) \approx a_1\phi_1(x) + a_2\phi_2(x)$$

$$H_\alpha \phi(x) = \lambda \phi(x)$$

$$F_\alpha[\phi(x)] = 0$$

$$\langle \psi_1 | F_\alpha(\hat{\phi}(x)) \rangle = 0$$

$$\langle \psi_2 | F_\alpha(\hat{\phi}(x)) \rangle = 0$$

Boris Galerkin

How it works

Quantum Harmonic Oscillator

Reduced Basis

$$\phi(x) \approx a_1 \phi_1(x) + a_2 \phi_2(x)$$

$$H_\alpha \phi(x) = \lambda \phi(x)$$

$$F_\alpha[\phi(x)] = 0$$

$$\langle \psi_1 | F_\alpha(\hat{\phi}(x)) \rangle = 0$$

$$\langle \psi_2 | F_\alpha(\hat{\phi}(x)) \rangle = 0$$

Two coefficients

Two equations*

Boris Galerkin

*Technically, there are three equations if you count the normalization condition. Plus, there is also the eigenvalue, so yeah, there are three equations. Funny that someone would write such a long footnote, makes you wonder if this is just a joke**.

How it works

Reducing your model in two easy steps:

Reduced Basis Method

1) Find good reduced coordinates

$$\hat{\phi}(x) = \phi_0 + \sum_k^n \underline{a_k} \phi_k(x)$$

Principal Component Analysis

2) Find equations for them

$$F_\alpha[\phi(x)] = 0$$

$$\langle \psi_j | F_\alpha[\hat{\phi}(x)] \rangle = 0 \quad j = \{1, n\}$$

One equation per coefficient

$$\begin{bmatrix} \hat{H}(\alpha) \end{bmatrix}_{n \times n} \begin{bmatrix} a_1 \\ a_2 \\ \vdots \end{bmatrix}_n = \hat{\lambda} \begin{bmatrix} a_1 \\ a_2 \\ \vdots \end{bmatrix}_n$$

Harmonic Oscillator Example

How it works

$$H_\alpha \phi(x) \equiv \left(-\frac{d^2}{dx^2} + \alpha x^2 \right) \phi(x) = \lambda \phi(x)$$

$$\phi(x) \approx a_1 \phi_1(x) + a_2 \phi_2(x) \quad \text{Linear Embedding}$$

Reduced Basis Method

$$\hat{\phi}(x) = a_1 \begin{bmatrix} \text{blue curve} \\ \text{blue curve} \end{bmatrix} + a_2 \begin{bmatrix} \text{orange curve} \\ \text{orange curve} \end{bmatrix}$$

How it works

$$H_\alpha \phi(x) \equiv \left(-\frac{d^2}{dx^2} + \alpha x^2 \right) \phi(x) = \lambda \phi(x)$$

$\phi(x) \approx a_1 \phi_1(x) + a_2 \phi_2(x)$ Linear Embedding

Reduced Basis Method

$$\hat{\phi}(x) = a_1 \begin{bmatrix} \text{blue curve} \end{bmatrix} + a_2 \begin{bmatrix} \text{orange curve} \end{bmatrix}$$

PCA Doctor

How it works

$$\phi(x) \approx a_1\phi_1(x) + a_2\phi_2(x) \quad \text{Linear Embedding}$$

Reduced Basis Method

<http://databookuw.com>

$$\hat{\phi}(x) = a_1 \begin{bmatrix} \vdots \\ \vdots \\ \vdots \end{bmatrix} + a_2 \begin{bmatrix} \vdots \\ \vdots \\ \vdots \end{bmatrix}$$

Me talking for half hour about this

To correct the behaviour of a low-order POD-Galerkin system, two numerical methods are here proposed and assessed. They consist in adjusting the polynomial coefficients which define the POD-Galerkin system by solving a minimization problem: the new ODE system has to recover optimally the dynamics of the data used to construct the POD and is computed in taking the original POD-Galerkin system into account.

III. DATA-DRIVEN PETROV–GALERKIN PROJECTION

Consider the linear discrete-time input/state/output system

$$\Sigma_{\text{true}} : \begin{cases} \mathbf{x}(k+1) = A_{\text{true}}\mathbf{x}(k) + B_{\text{true}}\mathbf{u}(k) + \mathbf{w}(k), \\ \mathbf{y}(k) = C_{\text{true}}\mathbf{x}(k) + D_{\text{true}}\mathbf{u}(k) + \mathbf{z}(k) \end{cases} \quad (5)$$

where $(\mathbf{u}, \mathbf{x}, \mathbf{y}) \in \mathbb{R}^{m+n+p}$ are the input/state/output and $(\mathbf{w}, \mathbf{z}) \in \mathbb{R}^{n+p}$ are noise terms. Throughout the article, we assume that the system matrices $(A_{\text{true}}, B_{\text{true}}, C_{\text{true}}, D_{\text{true}})$ and the noise (\mathbf{w}, \mathbf{z}) are *unknown*. What is known instead are a finite number of input/state/output measurements harvested from the system (5).

REVIEW ARTICLE

A tutorial on data-driven eigenvalue identification: Prony analysis, matrix pencil, and eigensystem realization algorithm

Anas Almunif | Lingling Fan | Zhixin Miao

Summary

To identify power system eigenvalues from measurement data, Prony analysis, matrix pencil (MP), and eigensystem realization algorithm (ERA) are three major methods. This paper reviews the three methods and sheds insight on

To correct the behaviour of a low-order POD-Galerkin system, two numerical methods are here proposed and assessed. They consist in adjusting the polynomial coefficients which define the POD-Galerkin system by solving a minimization problem: the new ODE system has to recover optimally the dynamics of the data used to construct the POD and is computed in taking the original POD-Galerkin system into account.

Interpolation among reduced-order matrices to obtain parameterized models for design, optimization and probabilistic analysis

Joris Degroote^{1,2}, Jan Vierendeels¹ and Karen Willcox^{2,*†}

In this paper, we introduce interpolation among the system matrices of the reduced models to efficiently handle nonlinear parametric dependencies. Our approach is efficient because, once an initial set of ROMs has been derived, obtaining a ROM solution for a new parameter value avoids any computations that depend on the dimension of the full-scale model. That is, at each new

Parametric Matrix Models

Patrick Cook^{*† 1,2}, Danny Jammooa^{*‡ 1,2}, Morten Hjorth-Jensen^{3,1,2}, Daniel D. Lee⁴, and Dean Lee^{1,2}

defined implicitly [1–6]. Here we introduce a general class of machine learning algorithms called parametric matrix models (PMMs), where the constraint equations to be solved are matrix equations. The dependent variables can be defined implicitly or explicitly, and the equations may use algebraic, differential, or integral relations. One very simple example is $M(\vec{c}) = M_0 + \sum_i c_i M_i$, where M_0 and each M_i are Hermitian matrices, and the final outputs are eigenvalues of $M(\vec{c})$. The PMM can be designed to incor-

Employment for New Physics Bachelors, AIP 2023

The slide is titled "SPARSE NONLINEAR MODELS OF FLUID DYNAMICS" and "Sparse Identification of Nonlinear Dynamics (SINDy)". It features a speaker in the foreground and several diagrams in the background, including a 3D visualization of a fluid flow, a 2D plot of a trajectory, and a diagram of a dynamical system with the equation $\frac{d}{dt} \mathbf{x} = \mathbf{f}(\mathbf{x})$. The slide also shows a list of identified models and their corresponding trajectories.

1 Widely applicable
Highly Transferable

2 Almost self trainable

3 Exponentially impactful

Sparse Identification of Nonlinear Dynamics (SINDy)

Employment for New Physics Bachelors, AIP 2023

Forecasting the future of artificial intelligence (2023)

Fig. 1 | The number of papers published per month in the arXiv categories of AI and ML are growing exponentially. The doubling rate of papers per month is roughly 23 months, which might lead to problems for publishing in these fields, at some point. The categories are cs.AI, cs.LG, cs.NE and stat.ML.

SPARSE NONLINEAR MODELS OF FLUID DYNAMICS

$\frac{d}{dt} \mathbf{x} = \mathbf{f}(\mathbf{x})$

6:33 / 24:05

Lowering the Barrier

Perfect opportunity for creating a more inclusive scientific community in the XXI century

Statistics & Machine Learning

The doubling rate of papers per month is roughly 23 months, which might lead to problems for publishing in these fields, at some point. The categories are cs.AI, cs.LG, cs.NE and stat.ML.

Exponentially impactful

RECOMMENDATION 1
The highest priority of the nuclear science community is to capitalize on the extraordinary opportunities for scientific discovery made possible by the substantial and sustained investments of the United States. **We must draw on the talents of all in the nation to achieve this goal.**

Coming up to speed summer course introductions!

General Programs ■ Coming up to speed 2024

Pablo 2023 FRIB-TA Organizer

10d

Hello! Welcome to the online space for all of our coming up to speed summer course needs. This is a space for everyone to write some introductions before the course actually starts to get the ball rolling on socialization efforts and creating a team!

I am Pablo Giuliani and I'll be part of the team that will go on this journey with y'all during this summer. I am super into cool physics and math topics, with machine learning and statistics sparkling everything. I like running with my doggie Dirac (see picture), eating a lot of good food with friends, playing piano, and starting reading Dune but never finishing it.

Super excited to meet you all!

General

Takeaways

About Dimensionality Reduction

- Two clear steps
- Bridge between emulation and Bayesian model combination

About Machine learning and Statistics

- 1) **Are** propelling nuclear physics towards a new era of **discovery**
- 2) **Could** help propel nuclear physics towards a new era of **inclusion**
