

# Tensor and Scalar Charges Searches and exclusives detection at EIC

Simonetta Liuti

# Outline

1. Introduction
2. Role of spin dependent observables in low energy processes (neutron beta decay, EDM)
3. Chiral Odd GPDs
4. Extraction from experiment: role of EIC
5. Impact on BSM searches
6. Conclusions and Outlook

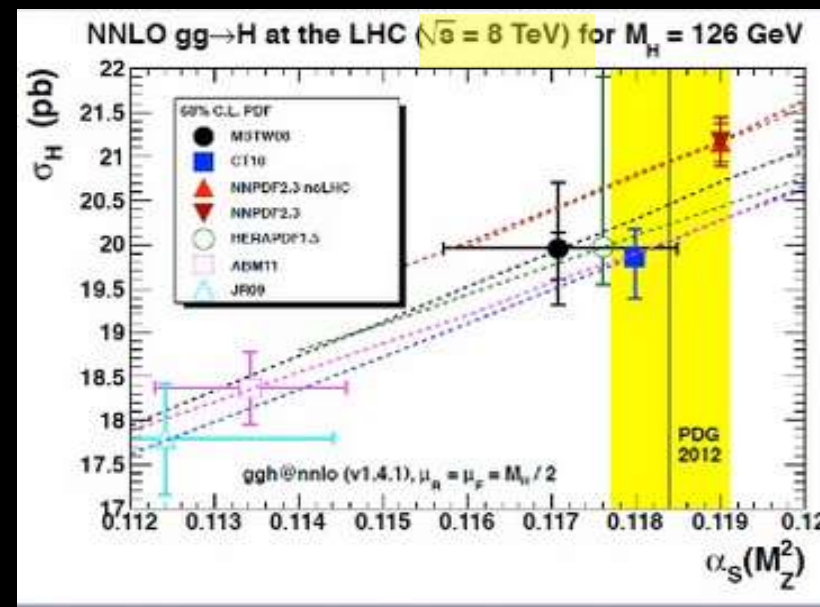

# 1. Introduction

## QCD impacts the extraction of several of the 19 (28) fundamental parameters in the SM

1. The Weinberg angle or weak mixing angle  $\theta_W$
2. The strong interaction coupling constant  $\alpha_s$
3. The electroweak symmetry breaking energy scale (or the Higgs potential vacuum expectation value, v.e.v.)  $v$
4. The Higgs potential coupling constant  $\lambda$  /the Higgs mass  $m_H$
5. The three mixing angles  $\theta_{12}$ ,  $\theta_{23}$  and  $\theta_{13}$  and the CP-violating phase  $\delta_{13}$  of the Cabibbo-Kobayashi-Maskawa (CKM) matrix
6. The Yukawa coupling constants that determine the masses of the 6 quarks.
7. ... + 3 charged leptons
8. Strong CP parameter
9. The fine structure constant  $\alpha$  (1)

At high energy the proton pdfs uncertainties govern the theoretical errors on crucial processes

## Example: Higgs production

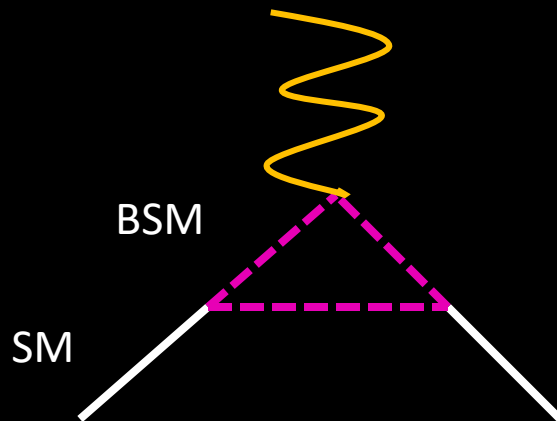

QCD affects also the low-energy regime in the indirect search for BSM physics:

1. CP violation in  $B$  mesons decays
2. Permanent Electric Dipole Moment (EDM) in hadrons and nuclei
3. Anomalous magnetic moment of the muon
4. Neutrino physics
5. PVDIS
6. Non V-A contributions in nuclear, neutron and pion beta decay
7. ....

Low Energy  $\ll 1$  GeV

High Energy  $\approx \Lambda_{\text{BSM}} > \text{"N" TeV}$

BSM particles appear  
in loops

BSM particles are produced  
directly

# BSM Effective Lagrangian

V. Cirigliano et al., Prog.Nuc.Part. Phys. (2013)

$$e_{L,R,S,P,T} \gg \frac{m_W^2}{\Lambda_{BSM}^2}$$

$$\begin{aligned} \mathcal{L}_{CC} = & -\frac{G_F^{(0)} V_{ud}}{\sqrt{2}} (1 + \epsilon_L + \epsilon_R) \\ & \times [\bar{\ell} \gamma_\mu (1 - \gamma_5) \nu_\ell \cdot \bar{u} [\gamma^\mu - (1 - 2\epsilon_R) \gamma^\mu \gamma_5] d \\ & + \bar{\ell} (1 - \gamma_5) \nu_\ell \cdot \bar{u} [\epsilon_S - \epsilon_P \gamma_5] d \\ & + \epsilon_T \bar{\ell} \sigma_{\mu\nu} (1 - \gamma_5) \nu_\ell \cdot \bar{u} \sigma^{\mu\nu} (1 - \gamma_5) d] + \text{H.c.}, \end{aligned}$$

Vector

$$\bar{u} g^m u$$

Axial-Vector

$$\bar{u} g^m g^5 u$$

Pseudoscalar

$$\bar{u} g^5 u$$

Scalar

$$\bar{u} u$$

Tensor

$$\bar{u} S^{mn} u$$

## 2. Role of spin dependent observables

# Differential decay distribution for polarized neutron decay

T.D. Lee, Chen-Ning Yang, Phys. Rev. 104 (1956)

$$\frac{d\Gamma}{dE_e d\Omega_e d\Omega_\nu} = \frac{(G_F^{(0)})^2 |V_{ud}|^2}{(2\pi)^5} (1 + 2\epsilon_L + 2\epsilon_R) \times (1 + 3\tilde{\lambda}^2) \cdot w(E_e) \cdot D(E_e, \mathbf{p}_e, \mathbf{p}_\nu, \boldsymbol{\sigma}_n),$$

$$D(E_e, \mathbf{p}_e, \mathbf{p}_\nu, \boldsymbol{\sigma}_n) = 1 + c_0 + c_1 \frac{E_e}{M_N} + \frac{m_e \bar{b}}{E_e} \quad \text{Fierz term}$$

$$+ \bar{a}(E_e) \frac{\mathbf{p}_e \cdot \mathbf{p}_\nu}{E_e E_\nu} + \bar{A}(E_e) \frac{\boldsymbol{\sigma}_n \cdot \mathbf{p}_e}{E_e}$$

These terms can contain tensor corrections

$$+ \bar{B}(E_e) \frac{\boldsymbol{\sigma}_n \cdot \mathbf{p}_\nu}{E_\nu} + \bar{C}_{(aa)}(E_e) \left( \frac{\mathbf{p}_e \cdot \mathbf{p}_\nu}{E_e E_\nu} \right)^2$$

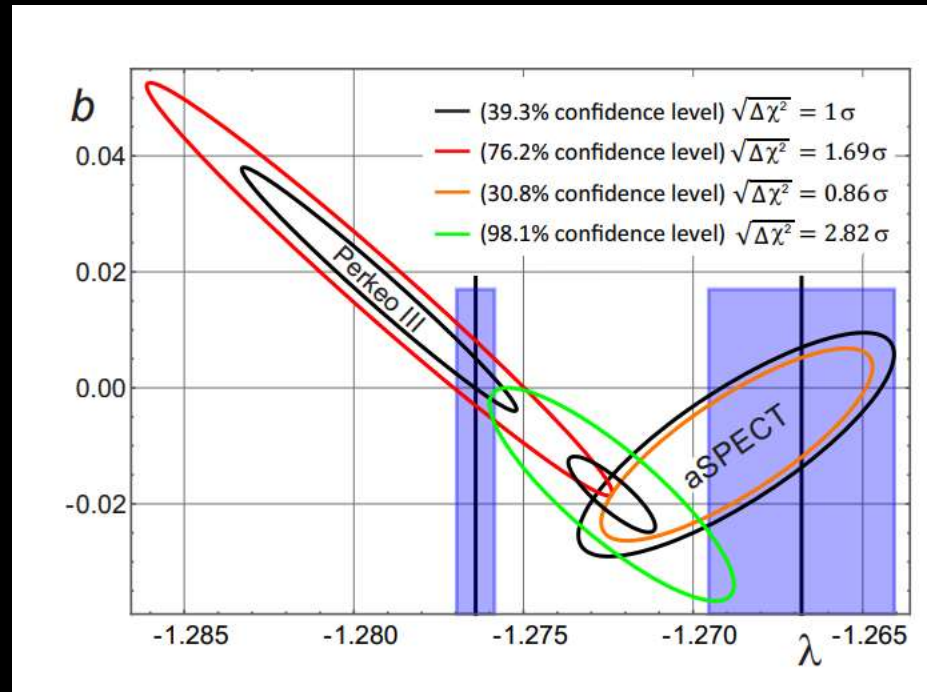

$$+ \bar{C}_{(aA)}(E_e) \frac{\mathbf{p}_e \cdot \mathbf{p}_\nu}{E_e E_\nu} \frac{\boldsymbol{\sigma}_n \cdot \mathbf{p}_e}{E_e}$$

$$+ \bar{C}_{(aB)}(E_e) \frac{\mathbf{p}_e \cdot \mathbf{p}_\nu}{E_e E_\nu} \frac{\boldsymbol{\sigma}_n \cdot \mathbf{p}_\nu}{E_\nu}, \quad (9)$$

# Reanalysis of aSpect experiment

M. Beck, W. Heil, Ch. Schmidt, S. Baeßler, F. Gluck, G. Konrad,  
and U. Schmidt: arXiv [2308.16170](https://arxiv.org/abs/2308.16170) (accepted in PRL)

Correlated analysis of Fierz term and  $\lambda = g_A/g_V$

b is found to be non-zero

## b decomposition in terms of tensor and scalar components

$$b = \frac{2}{1 + 3\lambda^2} [g_S \epsilon_S - 12g_T \epsilon_T \lambda]$$
$$b_\nu = \frac{2}{1 + 3\lambda^2} [g_S \epsilon_S \lambda - 4g_T \epsilon_T (1 + 2\lambda)],$$

$g_T$  and  $g_S$  are the flavor non-singlet/isovector hadronic matrix elements

$$\langle p_p, S_p | \bar{u}d | p_n, S_n \rangle = g_S(-t) \bar{U}(p_p, S_p) U(p_n, S_n) \quad ,$$
$$\langle p_p, S_p | \bar{u}\sigma_{\mu\nu}d | p_n, S_n \rangle = g_T(-t) \bar{U}(p_p, S_p) \sigma_{\mu\nu} U(p_n, S_n),$$

... or by using isospin symmetry:

$$\langle p'_p, S_p | \bar{u}u - \bar{d}d | p_p, S_p \rangle = g_S(-t) \bar{U}(p'_p, S_p) U(p_p, S_p) \quad ,$$
$$\langle p'_p, S_p | \bar{u}\sigma_{\mu\nu}u - \bar{d}\sigma_{\mu\nu}d | p_p, S_p \rangle = g_T(-t) \bar{U}(p'_p, S_p) \sigma_{\mu\nu} U(p_p, S_p),$$

- The precision with which  $\varepsilon_T$  ( $\varepsilon_S$ ) can be measured depends on the uncertainty on  $g_T$  ( $g_S$ )
- The observable is always the product of the fundamental coupling times a hadronic matrix element

$$C_T = \frac{G_F}{\sqrt{2}} V_{ud} g_T e_T$$

- Polarized hard scattering processes at Jlab @12 GeV and at EIC can provide the hadronic matrix elements to extract the BSM **tensor, scalar and pseudo-scalar** effective couplings entering the neutron beta decay cross section

- The most general form of gauge interactions with the exchange of a spin-1 particle is a linear combination of **VECTOR** and **AXIAL-VECTOR**
- The tensor charge is not “fundamental” in the SM
- A “tensor form factor” cannot be measured in elastic scattering processes mediated by either one or two photons

$$\langle p', \Lambda' | \pm i \bar{\psi}(0) (\sigma^{+1} \pm i \sigma^{+2}) \psi(0) | p, \Lambda \rangle$$

- The operator is chiral-odd: only connects quarks with opposite helicity

To detect chiral odd distributions we need another distinct hadronic blob

dihadron

$DV\pi^0P$ ,  $DV\eta P$

SIDIS

collinear

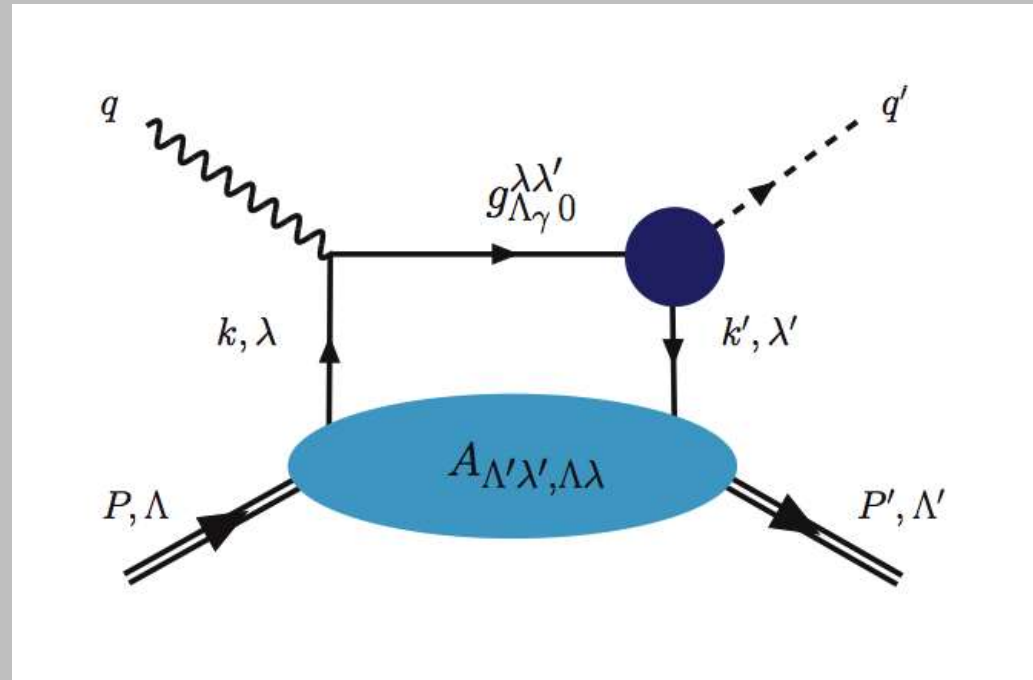

# 3. Chiral odd GPDs

# Deeply virtual pseudoscalar meson production $e p \rightarrow e' p' \pi^0$

process first suggested in S. Ahmad, G. Goldstein and SL, Phys.Rev. D79 (2009) 054014

$$\langle P' | \bar{u}(x) S_{mn} u(0) | P \rangle$$

# Consequences of having loop at amplitude level

- $\Delta$  is an observable ( $\Delta^2 = t$ ),  $p$  is not
- Both *Re* and *Im* parts are present:

$$\frac{1}{(p+q)^2 - m^2 + i\epsilon} = PV \frac{1}{(p+q)^2 - m^2} - i\pi d((p+q)^2 - m^2)$$

- Quark momenta and spins on LHS can be different from the RHS

# Light Cone Variables

Asymmetry in kinematics on LHS and RHS of diagram

## Quark correlator in the chiral odd sector: four GPDs

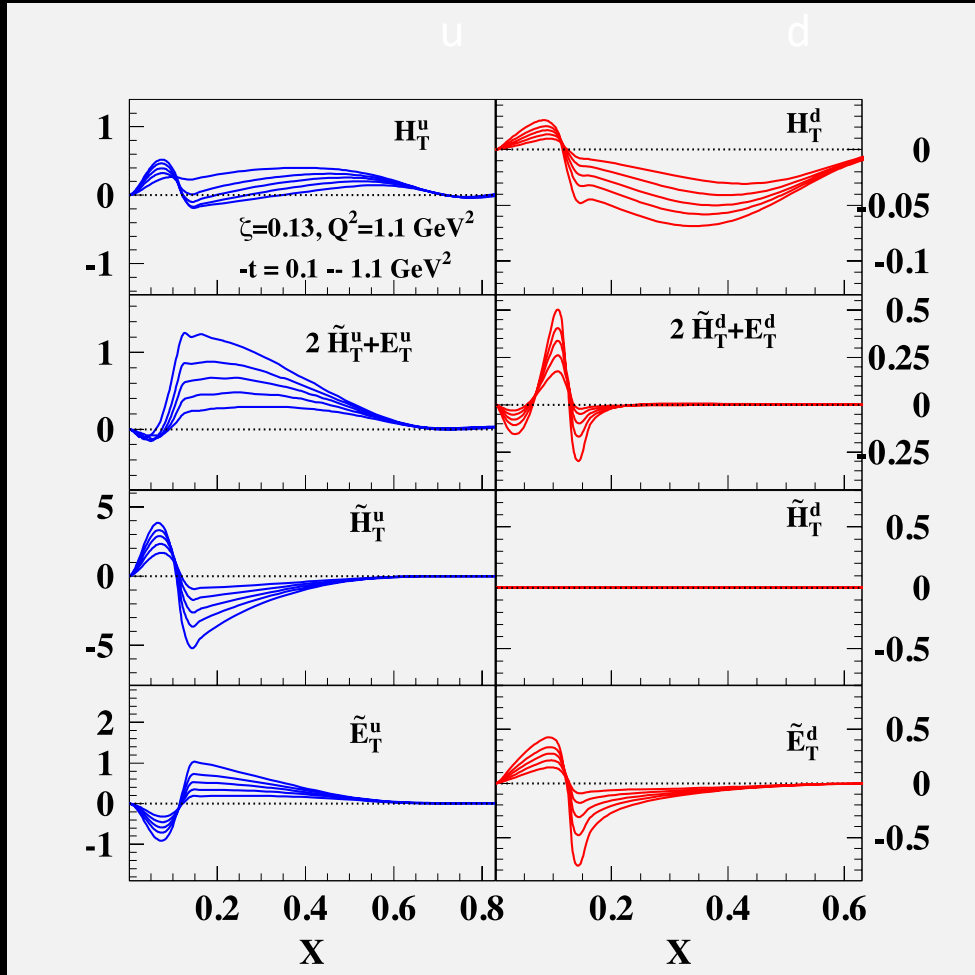

$$\begin{aligned}
 W_{\Lambda', \Lambda}^{[i\sigma^{i+}\gamma_5]}(x, \xi, t) = & \bar{U}(P', \Lambda') \left( \underline{i\sigma^{+i}H_T(x, \xi, t)} + \frac{\gamma^+ \Delta^i - \Delta^+ \gamma^i}{2M} \underline{E_T(x, \xi, t)} \right. \\
 & \left. + \frac{P^+ \Delta^i - \Delta^+ P^i}{M^2} \underline{\tilde{H}_T(x, \xi, t)} + \frac{\gamma^+ P^i - P^+ \gamma^i}{2M} \underline{\tilde{E}_T(x, \xi, t)} \right) U(P, \Lambda)
 \end{aligned}$$

## One to one relation with helicity amplitudes

$$\begin{aligned} \text{proton flip} \quad & \left\{ \begin{aligned} A_{++,-} &= \frac{\sqrt{1-\zeta}}{1-\zeta/2} \left[ H_T + \frac{t_0-t}{4M^2} \tilde{H}_T + \frac{\zeta^2/4}{1-\zeta} E_T + \frac{\zeta/2}{1-\zeta} \tilde{E}_T \right] \\ A_{+,-} &= -\frac{\sqrt{1-\zeta}}{1-\zeta/2} \frac{t_0-t}{4M^2} \tilde{H}_T \end{aligned} \right. \\ \\ \text{proton non-flip} \quad & \left\{ \begin{aligned} A_{+,+} &= \frac{\sqrt{t_0-t}}{2M} \left[ \tilde{H}_T + \frac{1-\zeta}{2-\zeta} E_T + \frac{1-\zeta}{2-\zeta} \tilde{E}_T \right], \\ A_{-,-} &= \frac{\sqrt{t_0-t}}{2M} \left[ \tilde{H}_T + \frac{1}{2-\zeta} E_T + \frac{1}{2-\zeta} \tilde{E}_T \right]. \end{aligned} \right. \end{aligned}$$

# Chiral Odd GPDs

## OUR PEOPLE

Computer Science/Machine Learning: Douglas Adams, Tareq Alghamdi, GiaWei Chern, Brandon Kriesten (10%), Yaohang Li, Saraswati Pandey, RA2

Experiment: Marie Boer, Debaditya Biswas, Postdoc

Lattice QCD: Michael Engelhardt, Huey Wen Lin, Postdoc

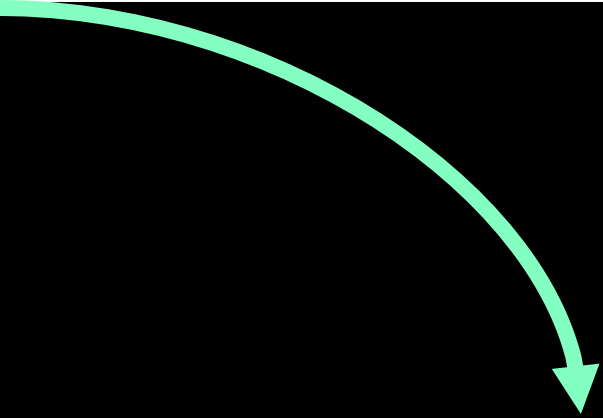

Phenomenology/Theory: Joshua Bautista, Marija Cuic, Andrew Dotson, Gary Goldstein, Carter Gustin, Adil Khawaja, SL, Zaki Panjsheeri, Kiara Ruffin, Matt Sievert, Dennis Sivers, RA2 NMSU

## OUR PLAN

EXCLAIM is developing physics aware networks by using theory constraints in *deep learning* models (not PINN)

1. ML is not treated as a set of “black boxes” whose working is not fully controllable
2. Utilize concepts in *information theory and quantum information theory* to interpret the working of ML algorithms necessary to extract information from data
3. At the same time, use *ML methods* as a *testing ground* for the working of quantum information theory in a large class of deeply virtual scattering processes

Does one need AI/ML for the analysis?

Draw from expertise on Global Analyses of Parton Distribution Functions (PDFs) from inclusive scattering experiments

- A major component is in the role played by **Uncertainty Quantification**
- Epistemic and aleatoric uncertainty
- Moreover, the **learning methods using ML** allow us to obtain **“more”** from the analysis
- **“More”** >>>>> access to latent space

## Zeroing in on a Fundamental Property of the Proton's Internal Dynamics

APRIL 28, 2023

This work was supported by the Department of Energy Office of Science, Nuclear Physics program under the Coordinated Theoretical Approach to Transverse Momentum Dependent Hadron Structure in QCD (**TMD Topical Collaboration**)

Gamberg, L., *et al.* (JAM Collaboration), **Electron-Ion Collider impact study on the tensor charge of the nucleon.** *Physics Letters B* **816**, 136255 (2021). [DOI: 10.1016/j.physletb.2021.136255]

You have to answer for men's bad behavior, which is insane, but if you point that out, you're accused of complaining. You're supposed to stay pretty for men, but not so pretty that you tempt them too much or that you threaten other women because you're supposed to be a part of the sisterhood.

But always stand out and always be grateful. But never forget that the system is rigged. So find a way to acknowledge that but also always be grateful.

You have to never get old, never be rude, never show off, never be selfish, never fall down, never fail, never show fear, never get out of line. It's too hard! It's too contradictory and nobody gives you a medal or says thank you! And it turns out in fact that not only are you doing everything wrong, but also everything is your fault.

America Ferrera's Monologue, Barbie (2023)

# In conclusion: Why is the tensor charge interesting? (summary)

- ✓ It describes a specific response of the nucleon to polarization but it is not a fundamental object → composite structure
- ✓ It evolves in PQCD but it does not couple to gluons (valence-like structure)
- ✓ Because the anomalous dimensions do not vanish for the first Mellin moment, the tensor charge evolves with  $Q^2$
- ✓ These studies are of interest for both the “BSM” and “hadronic” communities

## Conclusions and outlook

The possibility of obtaining the scalar and tensor form factors and charges directly from experiment with sufficient precision, gives an entirely different leverage to neutron beta decay searches

We outlined an approach to extract the tensor charge from measurements of hard electron proton scattering processes (DVMP, Dihadron electroproduction, single jet SIDIS). This program can be developed at the EIC

However, the error on  $\varepsilon_T$ , depends on both the central value of  $g_T$  as well as on the relative error,  $\Delta g_T / g_T$ , therefore, independently from the theoretical accuracy that can be achieved, experimental measurements are essential since they simultaneously provide a testing ground for lattice QCD calculations.

More precise measurements of “features” of the structure of hadrons give insight on:

1) *longitudinal and transverse spin structure, role of orbital angular momentum, QCD factorization*

2) *strongly coupled gauge theories from high energy (models of dark matter) to low energy description of lattices with QCD symmetry from cold atoms, Wigner distributions at the femtoscale...*
